- Invite your family member to co-join the device, share with multiple people to view a device.
- **Remark: Wi-Fi route must be 2.4GHz**

Phone Operation

How to set the alarm value?

How to find device's ID?

***If the user cannot find device on APP, please check these:**

- Please turn on the WIFI on the device to make the device enter the configuration network state (the WIFI icon flashes).
- Please enable the location service on your cell phone.
- Please enable Tuya function in the Setting of your cell phone..
- When find the device to pair with APP, the cell phone needs to connect to 2.4GHz WIFI.

***If the device can be configured normally, but the disconnection occurs, please note the following points:**

- The device should not be too far away from the router. Avoid walls and physical obstructions between device and the router.
- Check for WIFI channel interference. Too many routers or too many 2.4GHz devices in the same place may affect the channel quality. The router needs to be configured to change the channel.
